

EMAIL CONVERSATION MANAGEMENT SYSTEM

ABSTRACT OF THE INVENTION

An email system has a repository of messages. The message repository is searched to identify one or more messages relevant to a search query. Each identified message is associated with a conversation, and each such conversation has one or more messages and a unique conversation identifier. A set of conversation identifiers associated with the identified messages is collected and a list of conversations is created, where conversation in the list corresponds to a respective conversation identifier in the set of conversation identifiers.
